REDUCE HEATSOAK
MAINTAIN CONSISTENT TEMPERATURES

Tranmission Cool Pad

Sku: TRANSPAD

Transmissions are constantly pumping fluid through them, which causes heat buildup. When you use the cool racing parts pad with your racing transmission, it helps to reduce clutch pack failure due to build heat. This product absorbs transmission temperatures into the pad, making it an ideal cooling race part for drag racers looking for a competitive advantage in their consistent time runs, especially with comp dragsters or cars with manual valvebodies. This pad should be used before or after your racing vehicle performs a pass down the track, or after hot lapping. This pad enables more precise dial-in adjustments, granting you a competitive advantage.
