CL Brakes (anciennement Carbone Lorraine) fabrique des plaquettes de frein haute performance en métal fritté pour la compétition automobile, moto et vélo sur son site de production à Gennevilliers en France. Doté d'un savoir-faire en aéronautique et ferroviaire, CL Brakes est devenu la référence en matière de frein performance que se soit en rallye ou sur circuit.

CL Brakes possède son propre département R&D avec son banc d'essai dédié à la recherche automobile. Il simule le plus fidèlement possible les conditions d'utilisation d'une voiture lors des phases de freinage.

Les programmes de freinage développés en relation étroite avec ses teams et pilotes de pointe permettent d'élaborer des programmes de simulation aptes à reproduire, à l'aide de systèmes embarqués d'acquisition de données, les conditions de freinage les plus diverses. Les nouvelles compositions sont alors élaborées par les ingénieurs en matériaux puis testées sur le banc d'essai. La validation de ces nuances se termine par une phase de tests en conditions réelles. Les ingénieurs n'ont de cesse de mettre en oeuvre tous les moyens pour permettre de faire évoluer la gamme de plaquettes et de proposer le produit le mieux adapté aux attentes des pilotes.

CL Brakes (formerly Carbone Lorraine) manufactures high performance brake pads in sintered metal for racing cars, motorcycles and mountain bikes in its factory in Gennevilliers, France. With a considerable know-how in the fields of aeronautics and railway, CL Brakes has become the reference for high performance braking on rally and circuit.

CL Brakes has a research and development department dedicated to the automotive market. Using our brake dynamometer we are able to simulate real world brake events.

Simulation software was developed with the help of top race teams and drivers using their data acquisition systems to accurately reproduce all types of braking conditions. New pad compounds are created by our engineers and then tested on the dynamometer as well as on actual cars in real conditions before the compounds are approved. Our engineers continually implement improvements to the brake pads to make the product applicable to the needs of the modern race driver.

Il existe deux types de matériaux de friction pour l'auto : les matériaux frittés et les matériaux organiques. Seuls les matériaux frittés peuvent répondre à l'ensemble des sollicitations d'une auto de compétition : Freinage puissant, échauffement, utilisation sous eau, poussière et boue, réactivité à froid.

Les plaquettes en métal fritté (sintered en anglais) sont fabriquées à partir de poudres. Le produit de friction contient au moins dix constituants (cuivre, bronze, fer, céramiques, graphites, ...). Chacun de ces constituants a un rôle essentiel au cours du frottement de la plaquette sur le disque (confort, bruit et performance).

Une fois mélangés, ces constituants forment le mélange de friction. Ce mélange est ensuite comprimé dans un outil qui lui donne sa forme finale.

La pièce obtenue est ensuite positionnée sur son support métallique cuivré puis introduite dans un four à plus de 900°C. C'est le processus de frittage : un constituant du produit fond, consolide le matériau et le brase sur son support. La plaquette est ensuite rectifiée, contrôlée puis emballée.

Ensuite, les matériaux subissent une multitude de tests sur les bancs afin d'obtenir la meilleure qualité de plaquette en toutes conditions. Toutes les données récoltées lors des tests, permettent aux ingénieurs de concevoir des produits encore plus performants.

Les plaquettes de frein CL Brakes ont été développées avec la technologie NoNiTech.

Cette technologie permet de fabriquer les produits sans Nickel, sans Plomb et sans Amiante. Conscient des effets nocifs de ces poudres, CL Brakes a fait l'une de ses priorités le respect de ses clients et de l'environnement.

Lors du freinage, des particules métalliques sont rejetées dans l'air et peuvent être respirées par l'homme.

Certaines d'entre elles sont jugées dangereuses pour la santé (allergie cutanée, cancer du poumon et diverses maladies).

Two types of friction materials exist for brake pads: organic and sintered.

Only sintered materials can meet all of the demands of a modern car; high initial bite, no fade at extreme temperatures, instant cold bite, and braking in water, mud or sand.

Sintered metal brake pads are composed of various metal powders. The friction compound consists of at least 10 elements (copper, bronze, iron, ceramics, graphite, etc.) and each element plays an integral part in the behavior of the brake pad (feel, noise and performance).

These powders are mixed together, and pressed into a mold at 30000psi to create the puck shape.

The brake pad puck is then placed onto the correct backing plate and inserted into a furnace at more than 900°C to begin the sintering process.

The various ingredients in the puck melt together and strengthen and braze onto the backing plate.

Once finished, the pad is machined to its final thickness, quality checked and packaged for delivery.

Each batch of material undergoes a multitude of tests on the in-house dynamometer to ensure the best quality product for all conditions. All data collected during the tests are reviewed by our engineers to develop our products even further.

CL Brakes pads have been developed with NoNiTech.

This technology allows us to manufacture our products without nickel, lead or asbestos.

Conscious of the harmful effect of these compounds, CL Brakes has applied this technology to ensure the safety of our customers and the environment.

Sintered brake pads consist of formed and pressed metallic powders and, during braking, these metallic particles are released into the atmosphere.

Special care should be taken when handling sintered brake pads as these particles can be harmful to your health.

RCS+

Coefficient de friction moyen

$$\mu = 0,40$$

Dernier né de la gamme, il convient parfaitement aux voitures légères (Formules monoplace), aux étriers avant et arrière pour une bonne répartition de freinage ou pour des conditions de courses avec peu de grip au sol. Il offre des niveaux d'usure et de bruit très faibles.

RC6

Coefficient de friction moyen

$$\mu = 0,50$$

Ce matériau a un très grand champ d'application possible, en rallye ou sur circuit. Il fait gagner des courses grâce à son rapport efficacité / facilité d'utilisation.

Il offre une très grande constance de friction à un niveau élevé. Son utilisation nécessite un liquide de frein de bonne qualité.

RC6-E

Coefficient de friction moyen

$$\mu = 0,46$$

Le RC6 Endurance offre un niveau de friction déjà élevé combiné à un niveau d'usure disque / plaquette très faible. Il permet d'économiser des changements de plaquettes lors de courses de 6 à 24H.

Comme les autres produits de la gamme, il se rode très facilement et garde une grande stabilité à chaud comme à froid.

RC8

Coefficient de friction moyen

$$\mu = 0,60$$

Ce matériau répond aux conditions de courses les plus exigeantes. On le retrouve sur des voitures de compétition de haut niveau (WRC, WTCC, Nascar, ZA V8, GT).

Il convient aux systèmes de freinage "groupe A" et s'utilise avec un liquide de frein haute performance.

Sa résistance à l'usure est accrue par rapport au RC6.

RC8-R

Coefficient de friction moyen

$$\mu = 0,60$$

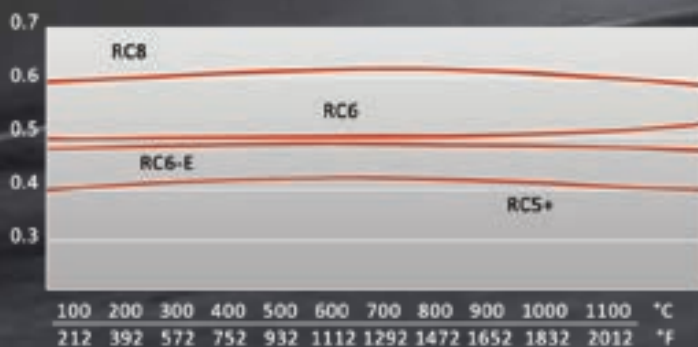

Il s'agit du même matériau que le RC8 sauf qu'un système de radiateur sous formes de rainures est proposé.

La chaleur est ainsi mieux évacuée et la surface de contact avec l'étrier est réduite.

Ce principe breveté est utile avec un système bien ventilé ou en cas de problèmes d'ébullition du liquide de frein.

Friction des plaquettes en fonction de la température

Composants à résistance thermique

Graphite, céramique, fer, cuivre et bronze

Préservation de l'environnement

Pas de plomb, pas d'amiante, pas de nickel

RC5+

Average friction coefficient

$$\mu = 0.40$$

The newest compound in our range, the RC5+, was developed for lightweight vehicles or racing in low grip conditions (street tires, gravel, mud, snow, water, etc.). An excellent track-day compound, it offers moderate friction levels, low noise, is easy on OEM discs, and has excellent cold stopping power. Additionally, it can be used on the front or rear axle of vehicles to change the brake bias where standard bias adjustment is not possible.

RC6

Average friction coefficient

$$\mu = 0.50$$

Our original compound, RC6 was designed to apply to a wide range of motor sports, from rally to circuit. It has a high and very flat friction level and can be used successfully in almost every type of race car. Low compressibility provides a stiff pedal which greatly increases feedback and allows for easier modulation. It can also be used in the front or rear axle combined with the RC8 or RC5 to adjust bias.

RC6-E

Average friction coefficient

$$\mu = 0.46$$

New in 2008, the RC6 Endurance was designed to offer very low pad and disc wear rates without sacrificing friction levels. Need pads to last 6, 12 or even 24 hours? Look no further than the RC6E. The RC6E boasts the same easy bed-in and stable friction levels as all the other CL Brakes compounds.

RC8

Average friction coefficient

$$\mu = 0.60$$

Developed in 2006, the RC8 compound boasts CL Brakes' highest friction level and is used in top-level motor sports such as WRC, WTCC, NASCAR, ZA V8, AWD GrpN, etc. Extremely high friction levels allow shorter stopping distances and the flat torque curve provides excellent modulation to prevent wheel lockup. The RC8 was designed to be used only with other CL Brakes compounds.

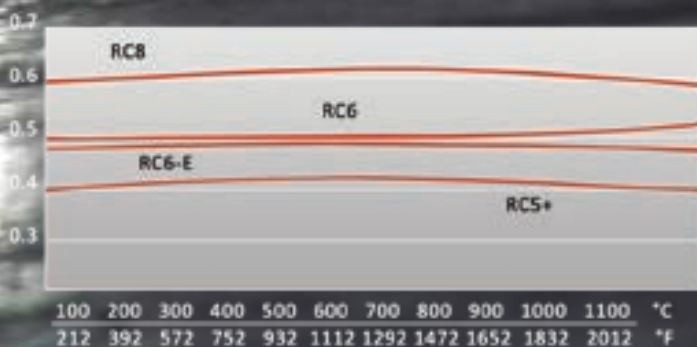

RC8-R

Average friction coefficient

$$\mu = 0.60$$

Using the same friction material as our standard RC8-R, we have grooved the backing plate to reduce the contact area with the piston and provide a radiator effect. This patented shape was created to reduce heat transfer through the piston and into the brake fluid.

Friction of pads according to temperature

Thermal resistant components

Graphite, ceramic, iron, copper and bronze

Environmentally friendly

No lead, no asbestos and no nickel

CL Brakes a mis en place un Système de Gestion et d'Assurance qualité afin de répondre aux exigences de fiabilité lors de l'utilisation des plaquettes de frein moto, quad, scooter, auto, VTT...

Le Système Qualité CL Brakes se réfère aux différentes normes en vigueur en France et à l'étranger (ISO 9001, TÜV...).

L'objectif est de garantir, au travers des différents stades de production :

- un contrôle des matières et des fournisseurs
- un contrôle de la fabrication
- un contrôle de l'emballage, du stockage et de la livraison
- une traçabilité
- un niveau de qualité comparable à celui des produits de première monte

Soucieux de la protection de l'environnement, en conformité avec la norme 14001 et pour garantir votre sécurité, nos produits ne contiennent ni plomb, ni amiante, ni nickel.

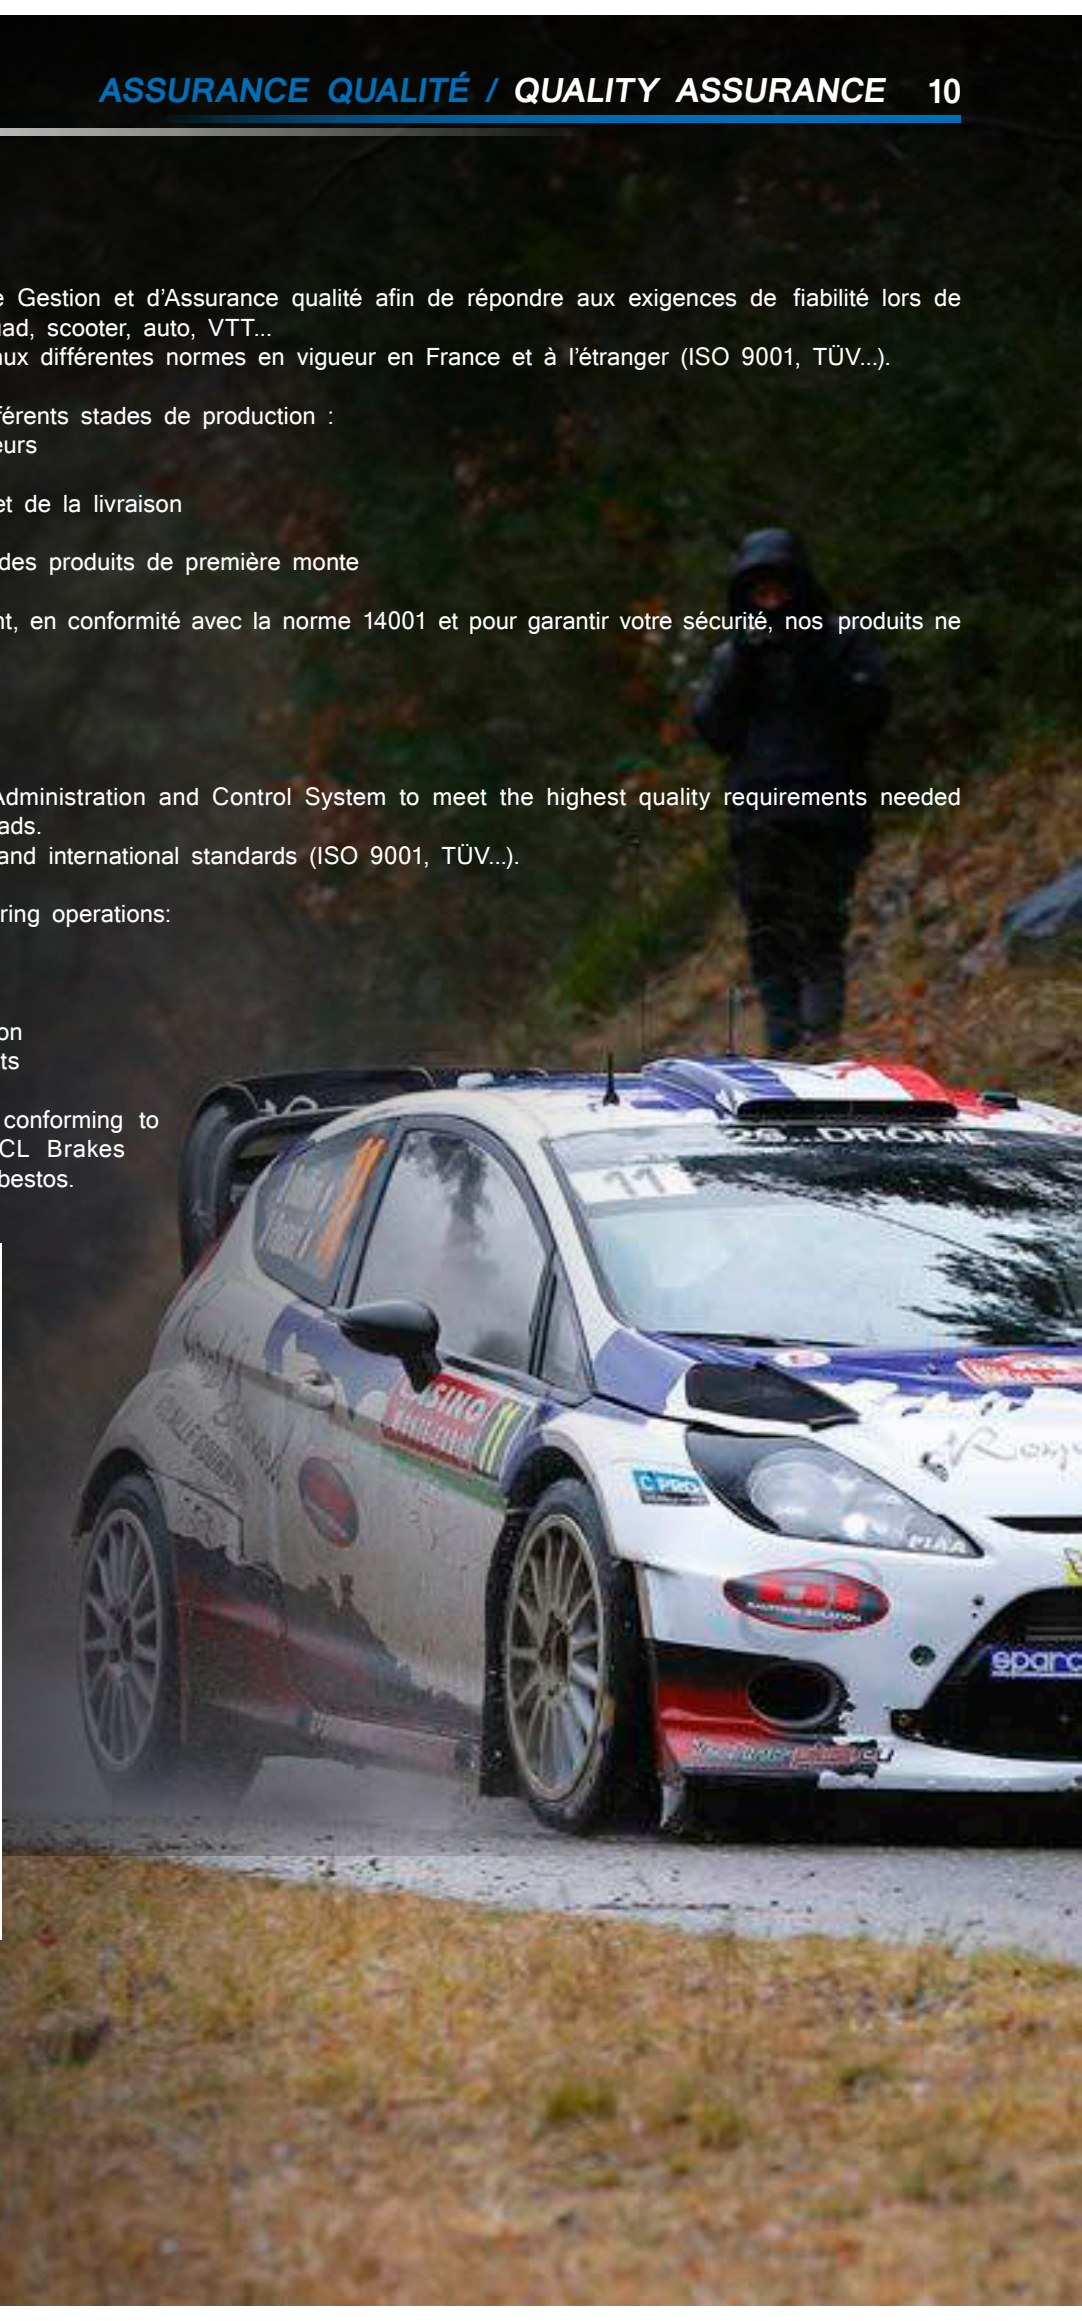

CL Brakes has implemented the Quality Administration and Control System to meet the highest quality requirements needed to ensure the best reliability for its brake pads.

The Quality System refers to both French and international standards (ISO 9001, TÜV...).

The objective is to guarantee all manufacturing operations:

- checking of raw materials and suppliers
- monitoring manufacturing processes
- tracking
- packaging, storage and delivery supervision
- quality equivalent to the OEM requirements

Concerned about environmental protection, conforming to the 14001 standard and for your safety, CL Brakes products are free from lead, nickel and asbestos.
