PERFORMANCE

PARTS

Est. 1919

WHERE WORLD-CLASS ENGINES BEGIN.

Whether your goal is to win your class in drag racing or circle track competition or simply command respect at regional and national car shows, the path to building a world-class engine begins with choosing the right parts from the right manufacturer.

Premier engine builders and performance enthusiasts worldwide master this journey with one of the industry's most respected and enduring brands — Elgin PRO-STOCK® high-performance components from USA-based manufacturer Elgin Industries.

From complete power-adding valvetrain packages to our impressive lineup of race-winning parts for GM LS Series engines, Elgin PRO-STOCK offers a proven path to unforgettable performance.

BORN AT THE BRICKYARD.

Elgin's racing heritage dates back to the early years of the Indianapolis 500 when the iconic Elgin Piston Pin Special — driven by the likes of Frank Brisko, Duke Nalon and Emil Andres — wowed thousands of spectators at the legendary Brickyard. Elgin technologies were also on display in an array of early stock car and road racing events, including the grueling Carrera Panamerica races of the early 1950s.

Fast forward to today: We can help you attack any performance challenge with precision-engineered, USA-quality components crafted from only the finest materials. These include:

- Camshafts
- Lifters
- Pushrods
- Rocker arms, studs & kits
- Valves, springs, inserts, retainers, locks & kits
- Valve guides & seals
- BLACK ICE™ super-cryo'd engine parts
- Timing sets
- Top end kits
- Oil pumps
- Head bolts
- Expansion plug kits
- Harmonic balancers & bolt kits
- Flexplates/flywheels & bolts
- Chassis parts

Elgin PRO STOCK® Camshafts: The Right Power for Every Engine

Elgin PRO STOCK cam and cam/lifter kits cover every conceivable performance requirement – from oval and drag racing to street performance to light-truck towing applications to marine engines to RVs. Regardless of your goal – boost low-end torque, increase fuel economy or just flat-out embarrass the “other guy” – you’ll find the answer right here.

Each Elgin PRO STOCK camshaft is precision-machined and hardened from a premium-quality blank manufactured in certified U.S. facilities. As a leading supplier of performance, standard automotive and RV camshafts, Elgin enjoys a well-earned reputation for quality, performance and value.

But first a few tips...and some hard-and-fast rules:

- Your new cam is highly dependent on the other parts you install. Don't lose sight of your performance objective by trying to save a few pennies on other components.
- **ALWAYS** replace the lifters when installing a new cam. Old lifters will quickly score the lobes of your new cam, leading to degraded performance and premature failure. Always use Elgin® Engine Pre-Lube (#EPL-4) on lobes and lifter bottoms.
- Be certain there is adequate CLEARANCE between the valves and pistons after installing your new cam. Failure to do so could lead to component failure. Also make sure the valve springs DO NOT coil bind with the new cam.
- Cam break-in procedures MUST be carefully followed to ensure superior performance and reliability. Do NOT allow the engine to run UNDER 1500 RPM for the first five minutes to one hour! This prevents spalling of critical cam surfaces, ensuring exceptional service life.

Camshaft Break-In Procedures

Important! As soon as the engine fires, bring the engine RPM to 1500 to 2000 during the first 30 minutes of operation. Slower engine speeds may not supply the camshaft with an adequate amount of oil for the break-in period. Change RPM periodically to direct oil splash to different areas of the camshaft. After the 30 minute break-in period, change the oil and filter again to be sure all contaminants and break-in lube are removed from the engine. If the camshaft you are using requires double valve springs, we recommend removing the inner spring for camshaft break-in.

It is highly recommended to use Elgin Remedy ZDDP-4 when breaking in a new flat tappet camshaft. This exclusive blend of zinc, moly and other proven wear additives will restore today's oils to pre-OBD quality and performance and ensure that your new Elgin cam and lifters will not prematurely wear.

There is absolutely no warranty on any parts used in racing applications. There is no warranty on products that have been physically altered, improperly installed or maintained, used in improper applications, abused or not used in conjunction with the proper parts.

Understanding Elgin PRO STOCK® Cam Ranges

To help you select the perfect part, Elgin PRO STOCK® cams are organized into five distinct performance categories, from nearly stock (Range A) to oval track and bracket racing (Range E).

The descriptions that follow cover cam performance characteristics within each Elgin PRO STOCK® range. (Please note: Durations shown are at .050" cam lift.) Recommended engine/vehicle modifications are listed to help you achieve your performance goals.

Range A (Hydraulic: Up to 195° Effective Duration)

Smooth stock type idle. Good low end torque in 1600 - 2000 RPM range. Operating power range 1000 - 3200 RPM. Best fuel economy cam with correct equipment. Good choice for heavy towing. Will work with stock or slightly modified engine, stock automatic or manual transmission. Compression 9.0 to 1 or less. Recommended spring pressure 95 lbs. for valve on seat; 240 lbs. for valve open. Stock axle ratio 3.50 to 1 and lower. Not recommended for racing.

Range B (Hydraulic: 195° - 210° Effective Duration)

Good to fair idle quality. Good low end torque and response in 1800 - 2600 RPM range. Good low end and mid-range power in 1500 - 4000 RPM operating range. Good fuel economy cam with correct equipment. Good choice for light towing. Compression 9.5 to 1 or less. Will work with stock or slightly modified engine, stock automatic or manual transmission. Recommended spring pressure 105 lbs. for valve on seat; 265 lbs. for valve open. Stock axle ratio 3.20 to 4.20 to 1 range. Not recommended for racing.

Range C (Hydraulic: 210° - 225° Effective Duration) (Mechanical: 220° - 235° Effective Duration)

Fair idle quality with lope. Good mid-range torque and response in 2400 - 3200 RPM range. Operating power range 2000 - 4800 RPM. Good fuel economy cam with correct equipment. Good choice for light towing. Compression 10.3 to 1 or less. Will work with stock or slightly modified engine, stock automatic or manual transmission. Recommended spring pressure 110 lbs. for valve on seat; 280 lbs. for valve open. Axle ratio 3.70 to 1 or higher is best. Recommended for mild bracket racing.

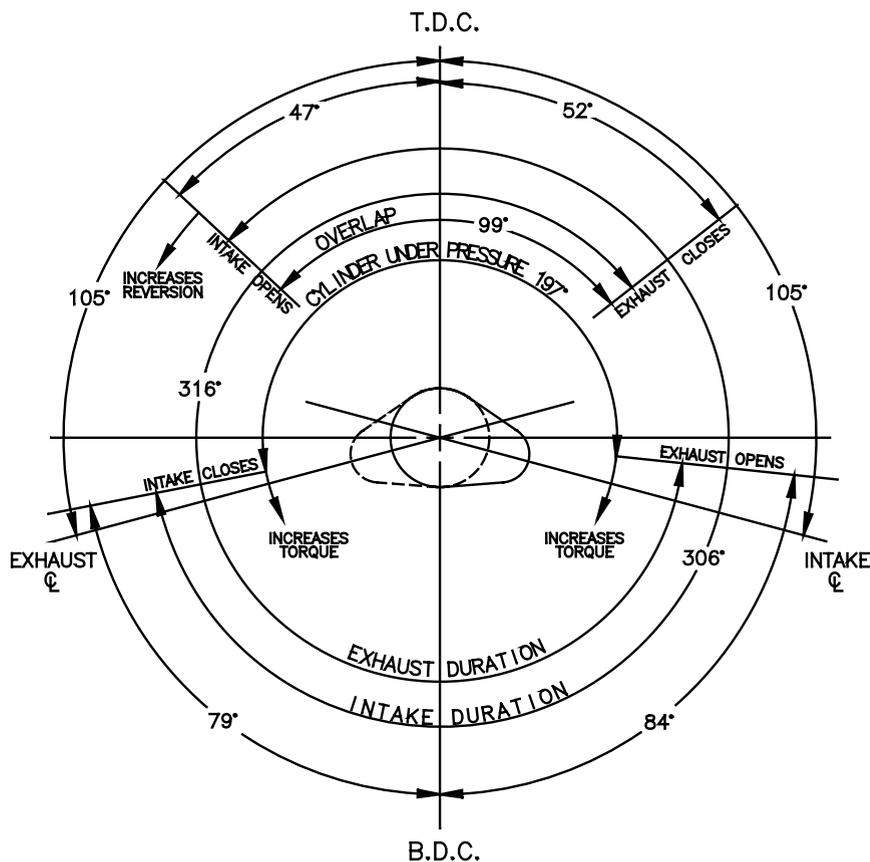

Range D (Hydraulic: 225° - 240° Effective Duration) (Mechanical: 235° - 250° Effective Duration)

Rough idle quality. (Note: Intake vacuum may be too low for power brakes, etc.) Good mid-range torque in 3000 - 4000 RPM range. Good mid-range power operating range 2200 - 5400 RPM. Average fuel economy cam. Not recommended for towing. Increased compression ratio best, 10.5 to 1 or 11.0 to 1. Some engine modification required. Use manual or automatic transmission with high stall converter. Recommended spring pressure 120 lbs. for valve on seat; 300 lbs. for valve open. Axle ratio 3.90 to 4.50 to 1 is best. Recommended for limited oval track.

Range E (Hydraulic: 240° - 255° Effective Duration) (Mechanical: 250° - 265° Effective Duration)

Rough idle quality with heavy lope. (Note: Intake vacuum will not operate power brakes, etc.) Good mid to high RPM torque in 3800 - 5000 range. Good high RPM power, operating range 3200 - 6500 RPM. Average to poor fuel economy. Definitely do NOT use for towing. Increased compression ratio required 10.5 to 1 to 12.0 to 1. Competition engine modifications required. Use only heavy duty manual or automatic transmission with high stall converter. Recommended spring pressure 125 lbs. for valve on seat; 325 lbs. for valve open. Axle ratio 4.20 to 1 is best. Competition headers and valve job recommended. Recommended for oval track or bracket drag racing.

How To Degree Your Camshaft

Degreeing a camshaft enables you to locate the valve motion in relation to the piston movement or, stated another way, to identify cam rotation relative to the rotation of the crankshaft. In short, it is an important step in maximizing engine performance.

Elgin PRO STOCK® engineers recommend using the “lobe center line” method - the easiest and most accurate process - to degree your cam.

Step 1: Find top-dead-center on the #1 piston.

Step 2: Locate the maximum lift point on the #1 intake lobe. This can be done by placing a dial indicator on the lifter and rotating the engine until maximum lobe lift is achieved. Note: You'll notice the crankshaft will rotate 2 to 3 degrees in either direction without registering on the indicator. To accurately locate maximum lift point, rotate the engine and allow the lifter to drop .050” on either side of maximum lift. Then count the number of degrees between these two points and mark the point halfway between the two outer marks. This is the “theoretical intake center line,” or maximum lift point.

Step 3: Locate this center line in the proper position in relation to top-dead-center. For example, if your cam is ground with 106-degree lobe separation and you want to install it straight-up, simply locate the “intake center line” at 106 degrees from the TDC mark. If you want to advance it 2 degrees, locate the intake center line at 104 degrees from TDC. (The valve timing diagram above will help you understand how cam location modifications affect an engine's torque characteristics.)

CLASSIC MUSCLE CAMSHAFTS

Chevrolet Small Block: 8 Cyl. 262-400 CID (1955-02)

1.5 RAR

All Small Block Chevrolet camshafts may be used in the '55-56 engines if late model cam bearings are used. Camshafts for the 265 engine must be modified by machining a slot in the rear journal .427" wide and .225"-.235" deep.

Chevrolet Big Block: 8 Cyl. 366-454 CID (1965-00)

1.7 RAR

When installing the following camshafts in the 1991 and later 454 "L19" V8 Engine with a "NET BUILD LASH" non-adjustable valvetrain, it may be necessary to convert to an adjustable valvetrain by using Pre-'91 valve components. The 1965-66 396 engines did not have an oil groove in the rear cam bearing bore. When using the camshafts below in these engines, it is necessary to machine a 3/16" wide x 7/64" deep groove in the center of the rear cam journal or the I.D. of the rear cam bearing.

Tech Tip: Calculating Lobe Separation Angle (LSA)

To calculate the lobe separation angle of a cam, simply add the intake and exhaust centerlines together and then divide that total by two.

Example: Take the E-1090-P camshaft. The intake centerline is 99 and the exhaust is 111.

$$99 + 111 = 210 \quad 210 / 2 = 105$$

105 is the lobe separation angle.

To calculate how many degrees of advance are built into a cam profile, simply subtract the intake centerline from the lobe separation angle.

Using the same example:

$$105 - 99 = 6$$

There is 6 degrees of advance built into this cam when installed straight up (dot to dot).

Using this information can increase your chances of properly dialing in your camshaft to fit your specific needs.

1.7 RAR

When installing the following camshafts in the 1991 and later 454 "L19" V8 Engine with a "NET BUILD LASH" non-adjustable valvetrain, it may be necessary to convert to an adjustable valvetrain by using Pre-'91 valve components. The 1965-66 396 engines did not have an oil groove in the rear cam bearing bore. When using the camshafts below in these engines, it is necessary to machine a 3/16" wide x 7/64" deep groove in the center of the rear cam journal or the I.D. of the rear cam bearing.

Specifically designed to be used in engines originally produced using roller tappets. Use the 351W Firing Order 1-3-7-2-6-5-4-8 when using in 1985-95 302 HO engines. Can be used in the 1985-89 302 Standard engine by re-wiring the distributor to Firing Order 1-3-7-2-6-5-4-8. On EFI applications, a mass air induction system must be used.

Tech Tip

One of the most common questions asked is "What type of distributor gear do I need to use with this camshaft?" Here's the answer:

If there were only one rule of thumb for choosing a distributor gear, it would be to always use a composite gear. Composite is compatible with every type of camshaft material.

Fortunately there is more than one option. For cast iron cams, a cast iron distributor gear is recommended. For steel billet cams, bronze is an option. And for ductile iron cams, the choices are melonized, hardened steel and again composite.

Use Elgin Remedy ZDDP-4 with your cams

Cam Bolt Lock Plate Kit

Chevrolet: 8 Cyl. Small Block / Big Block

Bendable Locking Tabs to secure bolts at any RPM. Grade 8 Bolts.

Kit Number	Kit Includes
839030	Lock Plate with Bolts

Elgin® Cam Buttons: For Roller Cams

Cam buttons are required to hold roller cams at the rear of the engine.

The cam button is positioned between the timing gear and front cover and is commonly shimmed for precise cam end play. Elgin offers both solid nylon type and high performance roller cam buttons.

Mfg.	Part Number	Description	Length
Chevy Small Block	SS-202	Nylon Thrust Button	.810"
Chevy Big Block	SS-205	Nylon Thrust Button	.945"
	SS-207	Roller Button	.945"

Chemicals

Elgin Engine Pre-Lube (EPL-4) is a scientifically blended oil with premium thickeners and additives designed to help ensure maximum lubrication when assembling an engine. It protects against scoring, scuffing, and coking of cams and metallic surfaces and is also recommended for use on bearings, gears, cam lobes, valve stems, lifters and all mating parts with close tolerances.

Elgin Remedy with ZDDP (ZDDP-4) is an exclusive, powerful blend of ZDDP (15,000 ppm per ounce), moly and other proven wear additives that restore oils to pre-OBD quality and performance. This industry leading formula is compatible with all engine oils and ideal for any on- or off-road racing engine.

Elgin Remedy Anti-Seize-(CAS-8) features an exclusive professional-grade formula that provides maximum resistance to corrosion and resists temperatures up to 2000° F.

Elgin Remedy White Lithium Grease (WLG-8) is a perfect way to prevent premature component wear caused by friction and/or corrosion.

LIFTERS

Elgin has a complete line of “standard” hydraulic lifters, high performance “anti pump-up” lifters, solid/mechanical lifters, Retro-Fit Tie Bar hydraulic and mechanical lifters and stock hydraulic roller lifters.

Elgin Pro Stock lifters are engineered and manufactured by the OEM suppliers to give you the peace of mind that when you purchase an Elgin lifter it is an exceptionally designed product that is held to the highest quality standards demanded by the original equipment manufacturers. Oil metering valves are tailored to the specific engine application to deliver precise lubrication of the overhead valve train components. The ball design check valve provides outstanding response and reliability. Plunger and check ball springs are precisely balanced to allow uniform operation at high speeds.

A few common sense tips that should be noted:

NEVER, EVER re-use old lifters when replacing the camshaft!! This is a recipe for disaster and will wipe out a cam very quickly. Use a reputable pre-lube and apply generously to all mating surfaces to prevent wear and tear on break-in. Elgin EPL-4 is recommended for use on all lifters and cams. Adhere to original equipment specifications for lifter pre-load for hydraulic lifters and the camshaft manufacturers recommendation for valve lash on solid lifter applications. Make certain that the lifter bores are “true” and the lifter spins evenly during and after break in period. A sticking lifter in a worn bore is a leading cause of camshaft failure. These tips will help ensure the lifters performance, reliability and durability.

Hydraulic lifters require proper pre-load. Correct pre-load should be set at .020”-.060”. On an adjustable valve train, first, tighten the adjusting nut while spinning the pushrod. When you feel a slight drag on the push rod, this is “zero-lash”. Next, turn the nut one-half to one full turn to achieve correct pre-load, which will vary depending on the lifter manufacturer and the thread pitch of the stud. Using a dial indicator is the best way to check proper pre-load. On a non-adjustable valve train, use an adjustable push rod and tighten the nut to zero lash. Check the length at zero lash and use push rods that are .020”-.060” longer to get to proper pre-load. Following these procedures will help to avoid excessive valve train noise due to insufficient pre-load and many other performance issues caused by too much pre-load.

Solid lifters require a lash setting that is determined by the camshaft manufacturer. Always use the manufacturers recommended settings. Most camshaft manufacturers will use a “hot lash” setting. When setting lash, tighten the nut until there is a slight drag on the feeler gauge to determine the correct lash setting. After the engine is hot, repeat this step as the measurement will change depending on the material of the head and block.

Hydraulic Roller Lifter/Lifter Guide Assembly for GM LS Engines with Active Fuel Management

HLG-7011FRA

- Complete Set for Entire Engine
- Pre-Assembled for Easy Drop-In Installation
- No Guess Work – Lifters are all Oriented in the Guide to Install the AFM and Non-AFM Lifters in the Correct Cylinders

Retro Fit Roller Lifters

Elgin Retro-Fit Lifters are the perfect choice for street performance engines and offer reduced friction, increased horsepower and performance. Manufactured in the USA, the outside diameters are to O.E specs for proper oil control.

To set the preload, tighten the rocker nut to zero lash and then turn the nut to the following recommendations:

- Cast Iron Head/Cast Iron Block - .025"
- Aluminum Head/ Cast Iron Block - .035"
- Aluminum Head/ Aluminum Block - .045"

This is based on the engine temperature of 70 degrees F.

Elgin Retro-Fit Lifters are recommended for use on spring pressures of less than 140 lbs. on seat and 380 lbs. open.

PUSH RODS

For over 50 years Elgin Industries has been perfecting the process of producing the finest push rods in the industry. From the very beginning our engineers have worked tirelessly with OEM engineers to improve product reliability and longevity and have created a partnership with the OEM's to assume the position of the preferred Tier One supplier of push rods for many of the most demanding engines in the world.

Elgin Industries utilizes the same principles in our aftermarket push rods. Our relentless pursuit of the best materials, engineering and design, manufacturing process and commitment to excellence and customer satisfaction makes us the company to look to for your push rod needs. Elgin's push rods are all manufactured in Elgin, Illinois. Our investment in the highest quality equipment including our state-of-the-art tube mill, welding equipment, in-house heat treat including cryogenic capabilities, grinding and finishing machines ensures that every push rod adheres to the tightest tolerances and hardness requirements.

Our high performance push rods have evolved over the years. Beginning with our 500 series welded ball design to the chrome-moly 700 series to our One-Piece thick wall push rods. Due to the overwhelming demand for these superior push rods, Elgin has added nearly 100 part numbers and lengths to our One-Piece push rod line. Offering you the greatest range of lengths you need for virtually any application. Elgin Industries is also committed to and constantly updating our manufacturing processes to adhere to the most up to date industry quality certifications (ISO 9001, IATF 16949) and is committed to the environment with our certifications (ISO 14001) as well.

Elgin Industries... THE push rod manufacturer!!!!

Elgin Industries Manufacturing

Elgin Industries engineers have developed a very sophisticated manufacturing process that allows us to produce multiple types of push rods simultaneously. We have several dedicated production lines specific to our OE customers and aftermarket products. We have production lines dedicated to welded end push rods and pressed end push rods and even a hybrid line for combination of pressed and welded ends. Because of all these dedicated production lines, Elgin has the capability to produce over 150,000 push rods every day. Elgin employees are highly skilled and trained in our manufacturing processes and perform periodic product inspections to ensure all push rods meet tolerances.

We have developed a unique welding system designed to hold lengths of our push rods to +/- .13mm. We can manufacture lengths ranging from 5-1/2" to 12" using either standard 1010 steel or 4130 chrome-moly. Our wall thicknesses range from a stock .060" tube to .137" in our 3/8" One Piece Push Rods. We utilize a centerless grinder and hard turning for our One Piece Thick Wall Push Rods to achieve a 210 degree radius on the ends for extreme lift and high performance camshaft profiles and will hold up to virtually any valve spring load.

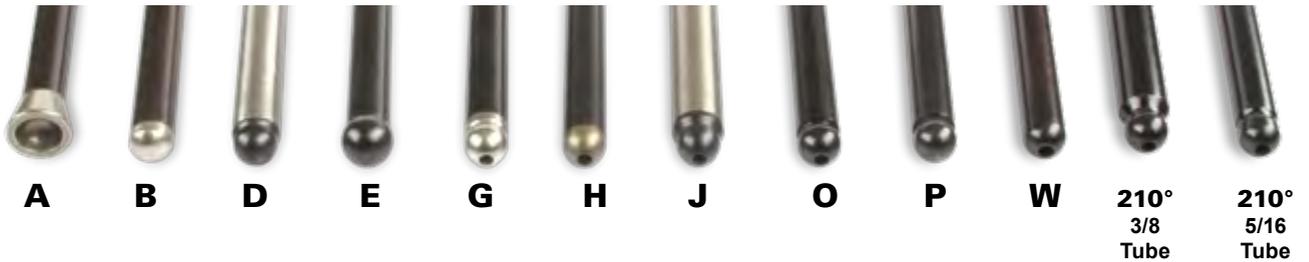

Cryogenic Capabilities

State of the Art Tube Mill

Tip Configuration Guide

- | | | |
|--|---|---|
| A = 5/16 Cup - No Oil Hole | G = 5/16 Pressed - Oil Hole 210° | P = 5/16 Welded - No Oil Hole |
| B = 3/8 Pressed - No Oil Hole | H = 5/16 Pressed - Oil Hole | W = 5/16 One-Piece - Oil Hole |
| D = 5/16 Pressed - No Oil Hole - 3/8 Tube | J = 5/16 Pressed - Oil Hole - 3/8 Tube | 210° = 5/16 One-Piece - Oil Hole - 3/8 Tube |

500 Series

- All 500 Series push rods feature 5/16" diameter and .075" wall thickness giving you 20% greater column strength than stock push rods.
- Manufactured from heavy wall 1010 carbonitrided steel tube for exceptional wear. Greater than 55 RC hardness. Deep case carburized 1018 steel ball ends with greater than 60 RC hardness. Rated for spring pressures up to 400 lbs.

One Piece Thick Wall Push Rods

- Manufactured from 4130 aircraft quality seamless chrome moly.
- Centerless ground and fully hard turned 210° radius ends.
- Through hardened and carburized tube with greater than 58 RC hardness and held to .005" maximum runout.
- Up to 40% greater column strength for superior strength and durability and increased stiffness to virtually eliminate compression and deflection which could lead to valve float and possibly catastrophic failure.
- Black oxide coated.

ROCKER ARMS

Selecting the correct rocker arm for your specific application and performance expectations is a critical decision to achieve your goals.

If you are doing a stock rebuild, a stock rocker arm is the best choice. Choosing a rocker arm with a long slot and increased ratio can be detrimental and possibly cause engine damage due to excessive valve lift. Valve to piston contact, valve spring coil bind, retainer to valve stem seal or guide and retainer to rocker arm contact are also other common issues that will lead to premature failure and engine damage.

In a performance build with a higher lift camshaft, there are several options available. A rocker arm with a long slot is recommended to avoid stud to arm contact. To reduce wear and fatigue on the valve stem, a roller tip rocker arm is the correct choice. For increased horsepower and faster response while simultaneously reducing valve tip wear and deflection, a full roller rocker arm is recommended.

Whatever your goals are, Elgin has a rocker arm to fit your needs. We manufacture stamped steel stock or long slot rocker arms with stock or higher ratios. Guide rail options are available for Small Block Chevy applications and roller tip versions as well. In-house heat treat operations allow us to offer these in a hardened "Nitro" version. For the best in durability and wear resistance, "Black Ice" cryogenically frozen rockers are the choice for most racers. Both offer the "stock appearance" in classes where rules dictate.

Elgin's stainless steel full roller rockers with upgraded roller trunnions have proven themselves to be the preferred option for high performance engines that demand extreme reliability.

ROCKER ARMS

LS Engine Stock Rocker Arms

Applications	Part Number	Description	Qty Per Vehicle
LS1, LS2, LS6	R-907	Exh. & Int.	16
LS3, L92	R-907	Exh. - Straight	8
	R-908	Int. - Offset	8

LS Engine Stainless Steel Drop-In Roller Rocker Arms

Applications	Part Number	Description
LS1, LS2, LS6	SSR-1907RS	Kit Includes 16 Straight Rocker Arms and 16 Premium Fasteners
LS3, L92	SSR-1915RS	Kit Includes 8 Straight Rocker Arms, 8 Offset Rocker Arms and 16 Premium Fasteners

Easily upgrade your stock rocker arms to a full roller rocker system with these drop-in style kits.

These rockers arms are manufactured from 17-4ph polished stainless steel and a heat treated Cr40 roller tip to reduce wear on the valve tip. Rated up to 400 lbs. open spring pressures.

The extra large full needle bearing trunnion is designed with a clip on the outside to keep the needle bearings in place and performing at peak efficiency.

Elgin Pro Stock Stainless Steel Full Roller Rockers Arms Feature an Extra Large Full Needle Bearing Trunnion designed to increase horsepower, provide quicker response, increase durability and allow high RPM stability with no deflection.

The large roller tip provides less friction and a smooth path over the valve tip which reduces wear on the valve to rocker contact area.

The upgraded trunnion has a clip on the outside to keep all the needle bearings in place and operating at peak performance.

The kits are conveniently clamshell packaged and include 16 rocker arms and Posi-Locks.

Hardened Steel Reinforced Push Rod Seat to reduce wear and fatigue.

Stamped Steel Roller Tip Rocker Arm Kits

- All rocker arms feature long-slot design
- H-11 tool steel roller and pin
- Precision ground roller (3 RA finish)
- Chevrolet Small Block 7/16" rocker arm kits feature ultra low friction dicronite coating on pivot ball
- Increase horsepower
- Reduce tip-rocker friction
- Reduced stud flex and failure
- Ensures smooth valve train operation

Choosing the correct valve spring is a critical component of every engine rebuild. Springs with too much open pressures will cause excessive wear on the cam lobes and “wipe” out a new camshaft quickly. Springs with too little pressures will lead to coil bind and cause catastrophic failure to any of the valve train components. Always refer to the camshaft manufacturers recommended spring pressures and **never re-use worn out valve springs. Even though they may look good to the eye, worn springs can severely affect the performance of your engine. Replace any spring that is more than 1/32 inch out of square, has experienced pressure loss of 10% or more or show signs of coil bind and/or worn ends.**

Other important factors to consider include the max lift of the camshaft, rocker arm ratio, installed height, retainer to oil seal clearance and rocker arm to retainer clearance. After all this has been determined, now it's time to choose the type of spring for your application. For stock or slightly modified engines, a single spring may work fine, but for more aggressive street performance engines, using a spring with a damper is a better choice for reducing harmonics and stability. For high performance and/or oval track use, a dual or dual with a damper is the best choice for handling the loads and high RPM's produced. A conical or “beehive” style spring can also be used for more aggressive cam profiles and with the ovate wire design and reduced O.D. from bottom to top, reduces resonance and has a dampening effect.

IMPORTANT:

Once the valve spring is installed, measure the distance between the bottom of the retainer and the top of the valve stem seal. This distance must be greater than the valve lift or contact will occur and produce failure to one or more of the components. Check for coil bind!!! There must be a minimum of .060” clearance between the coils of the springs. If that clearance does not exist, change to a spring that can handle more lift.

Whatever your needs, Elgin has a valve spring for you. Our wide range of styles, O.D.'s and pressure ratings give you the options for the correct spring for your application.

Elgin VSI's correct assembled valve pressure and height.

Serrated to retard heat transfer.

Manufactured from the finest quality shim stock.

Available in three different thicknesses to achieve correct spring height.

* 500 series come in .060" thickness only and have a lip on outer edge to prevent spring walk.

Elgin Pro Stock high performance valves forged from 21-4N stainless steel and feature hardened tips (55 RC min.) to eliminate the need for lash caps. The chrome plated valves provide excellent resistance to wear and corrosion and reducing friction. Undercut stems to improve airflow or straight stems for an OEM look. Some are available with +.100" lengths.

Elgin high performance valves are a perfect choice for street performance upgrades and mild race applications at a great value.

TIMING

Elgin ProStock offers a comprehensive line of high performance timing sets with coverage of all the leading high performance engines. Each set features the highest quality and workmanship to ensure the ultimate in performance, durability and value.

Elgin's 2100 and 3100 series sets are available with a chrome-moly 9 keyway crankshaft gear and cast camshaft gear. A 3 keyway steel crankshaft gear with a cast camshaft gear is also available. The 3100 series also has an option for all steel gears with a Torrington-type bearing. All sets feature a pre-stressed, .250" seamless roller chain to reduce stretching after installation and delivering smooth performance and exceptional durability.

Elgin recommends installing your timing set "straight up", with the dot on the cam gear in the 6 o'clock position and the dot on the crank gear in the 12 o'clock position. Precise alignment of the gears is crucial to get the most out of the camshafts performance.

Advancing the timing will result in more low-end power and retarding the cam will achieve more top-end power and higher RPM's. Many of Elgin's camshafts have some degree of advance built into them so it is recommended to check the cam specifications so you don't rob the camshaft of power and performance. To determine if the camshaft has advance built in, simply subtract the intake centerline from the lobe separation angle. If the cam does have advance built in, you should install it straight up (dot-to-dot).

Advancing or retarding of the timing of the camshaft can be achieved by installing the crank gear to the specific keyways cut in the gear. Generally by 4 degrees in a 3 keyway crank gear or in increments of 2 degree in a 9 keyway gear. Carefully follow the instructions included with the timing set.

9 Keyway Timing Sets

All Elgin PRO STOCK 9 Keyway Crank Sprockets are cut from 4140 Chrome Moly aircraft quality steel and hardened to 55 RC to maximize resistance to premature wear, offering the finest performance available. The 9 keyways represent two degree increments (in crankshaft degrees) to accurately time your performance engine as shown below.

- 0 = Standard Keyway
- R2 = 2 Retard A2 = 2 Advanced
- R4 = 4 Retard A4 = 4 Advanced
- R6 = 6 Retard A6 = 6 Advanced
- R8 = 8 Retard A8 = 8 Advanced

Add a K for a Skin Packaged Roller Speed Set

Elgin PRO STOCK oil pumps are 100% new and proven to protect the integrity of the lubrication system. Elgin PRO STOCK offers both High Volume (HV) or High Pressure (HP) pumps to satisfy the demands of your engines' requirements.

High Volume (HV) pumps are 100% pressure tested and dyno'd to ensure 20-28% greater volume (at the same pressure) as stock units for exceptional performance and engine protection.

High Pressure (HP) pumps are the best choice for ultra-high performance applications requiring consistent pump pressure. These pumps are fully pressure tested and hand turned before they earn their way into an Elgin PRO STOCK box. (When using an HP pump, carefully match the oil viscosity to the needs of the engine).

High Pressure Oil Pumps

Mfg.	Application	Part Number
Chrysler	318, 350, 361, 383, 400, 413, 426, 440	EM-63HP

HEAD BOLT KITS

Over the past few years, Elgin has partnered with several OE Tier-One head bolt suppliers to offer the OEM approved head bolts, for many late model engines, to the aftermarket. These partnerships ensure that when you purchase an Elgin head bolt set, you will receive an OE quality replacement part, MADE IN THE USA.

Torque-to yield bolts:

Most engines these days use these types of bolts right from the factory. Torque-to-yield means that after torquing to manufacturer specs, the bolts are stretched to their maximum limit and the bolt becomes permanently stretched, losing it's clamping force.

*****Do NOT re-use torque-to-yield bolts!!!! 100% replacement is required to avoid failure and costly repairs.*****

HARMONIC BALANCERS

Elgin® Harmonic Balancers provide true OE-style designs and materials that match the unique needs of each engine. Our harmonic balancers are new – never reconditioned – which ensures the best performance and value for every application. Our bolt kits feature Grade 8 bolts and washers and an extra thick parallel ground washer.

Harmonic Balancer Bolt Kits

Application	Kit Number
Chevrolet Small Block	HB12S
Chevrolet Big Block	HB13S

Look for these common signs that the harmonic balancer must be replaced:

- Front main seal leak
- Excessive engine vibration
- Inability to set ignition timing
- Deterioration of rubber between outer ring and hub
- Squealing or slipping belt drives
- Polished areas on pulley grooves

FLEXPLATES/FLYWHEELS

Elgin® Flexplates are manufactured from high quality .140" thick high strength steel plate and are engineered to exceed OE specifications. Our double-welded ring gears, dual bolt pattern and durable dichromate finish all combine for superior performance and reliability.

Chevrolet Flexplates (OEM Type)

Application	Year	Part Number	OEM Number	Outside Diameter	# of Teeth	Weight
4.3L 90° V6 Small Block V8 External Balance	86-Present	FP-5	10128414, 14088761	14.13"	168	with Weight
Small Block V8, Exc. 400	67-85	FP-1	471598, 340296	14.13"	168	w/o Weight
Small Block V8, Exc. 400	69-85	FP-4	471529	12.85"	153	w/o Weight
400 External Balance	70-76	FP-2	340298	14.13"	168	with Weight
Big Block, Exc. 454	90 & Earlier	FP-1	471598, 340296	14.13"	168	w/o Weight
454 External Balance	70-90	FP-3	343738	14.13"	168	with Weight

Flywheel / Flexplate Bolts

Application	Year	Set Number	Size	Set Includes Boxed
Flexplate Chevy 90° V6, V8	Prior to 86	FP-22S	7/16-20 x .680"	6 Bolts with lock washers
Flywheel Chevy 90° V6, V8 Ford V8	Prior to 86	FP-26S	7/16-20 x 1.000"	6 Bolts with lock washers
Flexplate Chevy 90° V6, V8 1 piece rear seal	86-93	FP-29S	7/16-20 x .680"	6 Bolts
Flywheel Chevy 90° V6, V8 1 piece rear seal	86-93	FP-30S	7/16-20 x 1.000"	6 Bolts

Elgin has a complete line of stock replacement Coil Springs for virtually every classic car and truck rebuild.

Elgin coil springs are manufactured from U.S.-grade steel wire and coated for exceptional protection from corrosion and road debris. Available designs range in free height from 9" to 21" and load height from 6" to 16". Available load ratings range from 175 to 6,000 pounds.

For specific application fitment, click on the Coil Spring Catalog tab at www.elginind.com

LIMITED LIFETIME WARRANTY

All engine and valve-train components are warranted to be free from defects in workmanship and materials for as long as the purchaser owns the vehicle into which said merchandise is installed. This limited warranty applies to the first retail purchaser only and exceeds normal wear. The warranty is void if the product is not installed correctly or normal recommended established precautions and installation procedures and testing are not followed.

Liability is limited to the repair or replacement of the defective part. The manufacturer retains sole discretion in determining defective merchandise and assumes no responsibility for diagnosis, removal, and/or installation labor, inconvenience or any other damages or expenses. Except to the extent applicable state law expressly mandates to the contrary, there are no other warranties of merchantability, fitness for a particular purpose or use, and all other obligations or liabilities whether for consequential or other damages (including damages to related parts) arising out of the items' sale, use, or operation. Neither the vendor of the item, its agent or sales representative or any other person is authorized to waive or alter any form or condition of this warranty.

To request repair or replacement of a defective item, please return merchandise in its original carton to the selling dealer. A copy of the dealer's invoice must accompany the defective item.

IMPORTANT! PLEASE READ

The use of O.E.M. part numbers or other terminology is solely for the purpose of assisting in selecting the correct replacement part. In compiling this catalog, reliable sources of information have been used; however, we cannot assume responsibility for errors. Listing of parts in this catalog does not guarantee their availability, as items are added and subtracted according to market needs and demands. There is no intent to represent any parts herein as being that of the original equipment manufacturer.

There is absolutely no warranty on any parts used in racing applications. There is no warranty on products that have been physically altered, improperly installed or maintained, used in improper applications, abused or not used in conjunction with the proper parts.

Please note: Elgin Industries is not responsible for camshaft compatibility with computer-controlled engines.

EMISSIONS WARNING! PLEASE NOTE

Local, state and federal law prohibit the removal or modification of any type of factory-installed emission device or system, or the use of any parts that could increase emissions in vehicles designed for use on public streets or highways. In some states the sale or installation on emission controlled vehicles of any device which alters or modifies the original design or performance of such vehicle's emission system is prohibited. Many of the parts listed in this catalog are intended for use on vehicles competing in competitive events or on other types of vehicles, which are exempt from the applicable emission control laws. Elgin recommends that the applicable emission control laws be reviewed prior to installation of any non-standard part.
